About the National Collaborating Centre for Healthy Public Policy

The National Collaborating Centre for Healthy Public Policy (NCCHPP) seeks to increase the expertise of public health actors across Canada in healthy public policy through the development, sharing and use of knowledge. The NCCHPP is one of six centres financed by the Public Health Agency of Canada. The six centres form a network across Canada, each hosted by a different institution and each focusing on a specific topic linked to public health. The National Collaborating Centre for Healthy Public Policy is hosted by the Institut national de santé publique du Québec (INSPQ), a leading centre in public health in Canada.

Introduction

This report presents findings from a scoping review with analysis of the literature on competencies for healthy public policy. It is intended to inform public health professionals about the trends and tendencies over the past 15 years or so related to what public health schools, organizations, and authorities have done and are doing with regard to developing competency frameworks as one tool for increasing their ability to intervene in public policy. In addition to presenting the findings, we suggest that increasing organizational capacity in this area is a promising way to move policy work forward.

BACKGROUND

In 2015, The National Collaborating Centre for Healthy Public Policy (NCCHPP) published a report outlining A Public Policy Competency Framework for Public Health Actors based on the recognition since the 1980s of the need to foster, develop, and implement healthy public policies, and on the use of competency frameworks to guide and support the work of public health organizations (Benoit et al., 2015). This work followed in the wake of an increase in the use of competency frameworks in public health to compose, develop, and sustain a workforce with the abilities and agilities required by the work. Competency based approaches focus on detailing the specific requirements of a role, usually based on extensive interviews with people in those roles, and are often used for recruitment and performance evaluation of workforces (Brahimi, 2011). In 2008, the Public Health Agency of Canada published Core Competencies for Public Health in Canada and over the following decade, other organizations, in Canada and elsewhere, have followed suit (Council on Linkages Between Academia and Public Health Practice, 2010; Belanger et al., 2012; Pan-Canadian Network for Health Promoter Competencies, 2014; Martin & Brahimi, 2014). The approach by competencies is often used as a tool for improving and streamlining the skills necessary for public health action.

Healthy public policy, as a concept and as a field of activity for public health, has developed over the past several decades as a way to act on the social determinants of health and advance health equity by promoting, adopting, and implementing policies that improve population health (Milio, 1987). First introduced in the 1980s, the World Health Organization [WHO] notes that “healthy public policy is characterized by an explicit concern for health and equity in all areas of policy and by an accountability for health impact” (1988). As part of our mandate to support Canada’s public health actors, the NCCHPP undertook a review of the literature on public policy competency frameworks for public health to understand how public policy competencies for public health have evolved over the last 15 years or so. This report presents the findings of the literature review, an analysis of the competencies presented in the documents we considered, and a discussion of what might further bolster public health’s ability to intervene effectively in the policy field.

1 Methodology¹

For this study, we conducted a scoping review and analysis of the scientific and grey literature on public policy competencies for public health, searching for frameworks and related documents. Following an adapted version of the Prisma Extension for Scoping Reviews (Tricco et al., 2018), in the fall of 2019, we found a total of 1668 publications: 1575 in the scientific literature and 93 in the grey literature.

ELIGIBILITY AND INCLUSION CRITERIA

To be eligible for the review, documents had to be published in English or in French between 2000 and 2019,² in countries ranked in the top 25 of the United Nations Human Development Index and thus with socioeconomic contexts similar to those in Canada (United Nations Development Programme, 2019). They needed to be concerned with public policy or public policy competencies, or with public health competencies or the evaluation of public health education programs or workforces.

To be included for analysis, the articles thus needed to fulfill the eligibility criteria outlined above as well as one of the following criteria: be about public policy and include a list of competencies; be a competency framework for public health (or another type of document which included a list of public health competencies) with at least a section devoted to public policy; be a compilation of, or discussion of, existing public health competency frameworks; or be a public policy competency framework specifically intended for public health actors.

After designing selection criteria, we read an initial 300 abstracts separately and discussed those concerning which our decisions differed, and refined our understanding of the inclusion criteria. One of us proceeded to read the remaining abstracts and classify them as yes, no, or uncertain. Those classified as uncertain were re-read by both of us and a decision was made together. From there, a second quick read-through of the articles allowed us to eliminate those that did not fit the criteria. The 78 articles included were read comprehensively in their entirety and classified into 4 categories: competency frameworks or related documents that specifically dealt with public policy without mention of public health; those that dealt specifically with healthy public policy; those that dealt with public health and had at least one section on public policy; and those that dealt with public health and had partial mentions of public policy in other sections.

For this project, we analyzed the 43 documents that related either to healthy public policy directly, or that had at least one section devoted to public policy within public health frameworks.³⁴ From the frameworks, we made an exhaustive list of the 361 competencies that appeared in the documents. Through an iterative process of reading, summarizing, and discussing, we were able to unpack a list of 41 different competencies. From there, we returned to the complete list and through a process of constant comparison inquiry (Butler-Kisber, 2010) we generated seven mutually exclusive thematic categories and one residual category, into which we placed each of the 361 competencies.

¹ A more detailed methodological account is included in Appendix A.

² Note that the cut-off date was later amended to 2005 to limit the number of articles and to more precisely target the time period when competency frameworks became more widespread in Canada.

³ In the remainder of this report, these are referred to as *the frameworks* or *the documents* interchangeably.

⁴ A full flux diagram of the selection process is presented in Figure 3 of Appendix A.

2 Categories of competencies in public policy for public health

Our review of the literature on competency frameworks in public health that include a component related to public policy suggests that policy is indeed seen as an area that public health actors need to be able to understand and act upon. Below, we present our thematic categorization of the competencies listed in the various documents and following that, a discussion of what this might mean as public health actors seek to build further capacity in the area of public policy. We outline what the literature suggests are the most important aspects of policy work for public health and provide a brief discussion of suggestions that individual competencies, while important in and of themselves, are best accompanied by capacity building at the organizational level if public health authorities are to more effectively intervene in public policy.

We divided the 361 competencies into eight categories. Some of the competencies are included in more than one category as they combined different elements required for policy intervention. It is worth mentioning here that leadership was mentioned in many of the frameworks, sometimes comprising a subsection within the lists rather than appearing as a standalone competency. When listed as a competency, it was always in relation to other categories and so these instances are categorized under those respective themes. It is further important to note that though the thematic categories are mutually exclusive, many of the competencies, as they appear in the documents, are composite and it was possible to place some of them into more than one category. As a result, the 361 individually listed competencies received a total of 570 category codes. Below, we describe each of the categories and present examples for each category in Table 1.

Policy Analysis/Development (PAD): Includes competencies related to the design, development, implementation, analysis, impact, and evaluation of policies related to public health. This includes knowledge of how policies are made, how they might impact population health, and the ability to delineate policy options for a specific public health problem using evidence based data. This category was by far the most frequently referenced one, accounting for 40% of all of the competencies listed, and mentioned in 41 of the 43 documents.

Influence/Advocacy (I): This category includes all of the competencies derived from the role of public health in advocating for policies that improve population health. Advocacy and influence are mentioned in relation to decision-makers, stakeholders, and the public, as is the ability to take positions on matters of policy that affect, or have the potential to affect, public health. Influence/Advocacy is the second most frequently referenced category of policy competencies, accounting for 14% of the 361 competencies, and is referred to in 32 of the 43 documents.

Partnership/Collaboration (P): This category includes all of the competencies related to forming partnerships and collaborations, working with community members and stakeholders, as well as those related to intersectoral collaboration. This category accounts for 14% of the competencies with mentions related to partnership occurring in 28 of the 43 documents.

Communication (C): The competencies in this category are concerned with the ability to effectively communicate with decision-makers and the public. Included here are competencies such as: strategic use of media; writing clear and concise policy briefs and memos; and stating policy options to different audiences. This category accounts for 13% of the competencies we found, and is referred to in 27 of the 43 documents.

Policy Context (PC): This category includes competencies related to the social, cultural, and political context within which public health intervenes. Knowledge of population composition, cultural awareness, health systems, political context, and jurisdictional responsibilities are classified as policy context competencies. Policy Context accounts for 10% of the competencies, and 21 of the frameworks and related documents mention it.

Social Determinants/Equity (SDE): This category includes all of the competencies that emphasize the importance of the social, economic, political, and environmental determinants of health and issues related to equity and health inequalities. 4% of the competencies we found were classified in this category with mentions in 10 of the 43 documents.

Policy Theory (PT): This includes competencies which emphasize familiarity with different theories of policy, politics, public health, intervention, and social theory. Only a small fraction (1%) of the competencies listed are found in this category and they are limited to four of the documents.

Other (O): This category is made up of competencies that were thematically unrelated to the other categories. These included competencies that related to implementing organizational, rather than public, policies and thus were not related to our inquiry, and some whose meaning we were unable to fully understand. There were competencies categorized as “other” found in 12 of the documents, accounting for 4% of the total competencies listed.

Table 1 Examples for each of the competency categories

Competency category	Examples
Policy Analysis/Development	Policy analysis; Policy development/design; Policy options; Public health problem analysis; Policy implementation; Evaluation/assessment; Policy making processes; Ethical analysis of policy; Legislative processes; Effects, impacts, implications of policy; Using data and evidence to inform policy.
Influence/Advocacy	Positions on policies and laws; Advocacy; Influencing policy; Influencing decision-makers; Influencing public opinion; Influencing stakeholders.
Partnership/Collaboration	Intersectoral collaboration; Partnership/collaboration; Stakeholders (identifying, engaging); Community involvement; Interpersonal skills; Engaging others in projects; Developing and maintaining contacts; leading collaborations.
Communication	Communication; Writing policy briefs, statements, memos; Informing partners; Strategic use of media; State policy options.
Policy Context	Socio-cultural awareness; Composition of population; Diversity; Evaluation of roles (private, government, sectors); Health system knowledge; Knowledge of political context/agenda; Political savvy; Jurisdiction (local, state, federal, tribal, Indigenous communities); Levels of intervention; Knowledge of laws and regulations; Identifying and seizing opportunities; Cultural differences.
Social Determinants/Equity	Understanding social determinants of health; Promoting health equity; Reducing health inequalities; Understanding specific needs of Indigenous populations.
Policy Theory	Knowledge of policy theories; Knowledge of public health theories; Knowledge of scientific basis of public health; Systems level thinking; Knowledge of specific approaches to intervention.
Other	Translation of policy into organizational planning and public health practice; Application of existing organizational policy; Miscellaneous or unable to categorize.

Figure 1 below presents the percentage share for each of the seven thematic categories as well as for the residual “other” category.

Figure 1 Share of each competency category

*Note that for the above graphic, N=361. In other words, 40% of the 361 competencies fall into the category of Policy Analysis and Development.

3 Discussion

It was not surprising that 40% of the 361 competencies listed in the documents we analyzed fall into the **Policy Analysis/Development** category as this category combines many of the skills necessary to understanding and designing policies. Competencies related to policy analysis and development appear in virtually all of the lists. An interesting observation is that many of the competency frameworks do not distinguish between public policy and organizational policies and programs. Indeed, in a large number of the frameworks they are listed together under one competency (for example, one framework lists the ability to “collect and analyze data and other information to guide evidence-based policy and program development” [#2]).⁵ This is not an uncommon way to characterize the competencies. The ability to analyze existing policies and their impacts on health outcomes appears frequently, as does the ability to outline policy options and their potential impacts on population health. The role and importance of accessing and using evidence is noted in many of the documents. The ability to understand the policy-making process appears frequently, as well, although, as discussed below, we found very little detail regarding what is involved.

Other sources (David, 2019; Degroote & Lessard, 2016; Guyon et al, 2017) have determined that various health authorities use or have developed tools to help orient their policy work, but this is not mentioned in the frameworks we analyzed and it is therefore difficult to understand how such competencies are developed and supported.

The next three categories had very similar representation. Fully 14% of the 361 competencies fall into the category of **Influence/Advocacy** and, indeed, the majority of the frameworks include some mention of advocacy or the ability to influence stakeholders, whether these be policy-makers or community members, or to influence public opinion on public health and policy matters. These competencies are sometimes framed directly as advocacy, as in, “Advocate for political, social or economic policies and programs that will improve health in diverse populations” (#41), or, as was also frequently the case, in terms of educating others, as in for example, “Educates decision-makers, media partners, and the general public by providing relevant information” (#20). The role of the public health actor, in this instance, is portrayed as that of being both educator and influencer, providing relevant knowledge as well as nudging decision in directions that put public health at the centre of policy considerations.

Partnership/Collaboration is mentioned frequently as a competency necessary to doing policy work within public health. Relationships included those between public health and community members and organizations; between public health and decision-makers; as well as between sectors and levels of government. These competencies range from the very general ability to “build alliances, partnerships, and coalitions to improve the health of the community or population being served” (#15) to ones that suggest more systematic approaches to stakeholder analysis, such as, being able to “identify critical stakeholders for the planning, implementation and evaluation of population health policies/programs/interventions” (#4). It is clear from the importance given to this category that partnerships, collaboration, and inter-sectoral work are considered to be crucial to public policy work for public health practitioners and organizations.

⁵ The numbers listed in parentheses in this section refer to the numbers assigned to the documents analyzed. The full list of documents with their assigned numbers can be found in Appendix C.

Communication, and the ability to communicate strategically in different contexts and with different audiences is also an area that is considered to be an important part of the work of public health actors engaged in policy intervention. These competencies ranged from the general ability to communicate with different audiences, as in the “ability to engage diverse audiences” (#29) to using communication devices specific to the policy domain, as in “write policy briefs” (#35) or “understands the role of the media and its interface with public health policy and practice” (#31). There is a clear indication, from the competency frameworks and related documents we analyzed, that communication is key to intervening in public policy for public health actors.

The next most commonly referenced category of competencies is what we have called **Policy Context**. These competencies indicate a perceived need for policy actors to know the sociodemographic and political contexts in which they work. Sometimes these competencies included jurisdictional concerns and knowledge of different agencies, as in “describe federal and state regulatory agencies, programs, policies and guidelines” (#33) and others referred to the importance of understanding the needs of diverse populations, as in for example, “apply awareness of cultural values and practices to the design or implementation of public health policies or programs” (#41). Many of the frameworks also refer to the need to know the specific policy context and be able to understand the policy scene: “knowledge of developing trends to inform the process of policy development” (#30), or “‘political savvy’ – understand historical and present north-south power dynamics and social and political contexts” (#38). Knowledge of the actors, the populations, and the political dynamics and agendas of a given context are thus deemed essential by many of the competency frameworks.

Surprisingly, only a small percentage of the 361 individual competencies mentioned the **Social Determinants** of health or issues surrounding health inequalities or **Equity**. A typical example of these is “identify opportunities for policy development that will improve health and wellbeing and reduce inequalities” (#36). While the small number is surprising given the centrality of these themes in public health over the past several decades, it is worth keeping in mind that we analyzed only those frameworks, or sections of frameworks, that dealt directly with competencies related to public policy. We suspect that as the vast majority of the material we analyzed came from policy sections of broader frameworks, competencies related to equity and the social determinants of health were very likely found in other sections of the frameworks. Given that policy often drives the conditions that create and sustain both the social and structural determinants of health and health inequalities, the absence of these competencies is notable.

Only a very few of the competencies explicitly mentioned **Policy Theory**. Only one framework, for example, listed “knowledge of policy theories” (#30) as a competency. This was notable to us. The most commonly appearing competencies were found in the Policy Analysis/Development category and to be effective in this area a theoretically informed approach to policy is required. This element may be implicit in many of those competencies, but is only mentioned explicitly in a few instances. Public health actors, of course, are not often political or policy scientists, but given the increasing importance of public policy as a field of activity, the lack of attention to theories of the policy-making process, stakeholder analysis, and other theoretically grounded approaches is significant. In future, knowledge of policy theory might be usefully incorporated into competency frameworks related to policy. Given the infrequent mention of knowledge of policy theory as a necessary competency, we might wonder if policy analysis could be bolstered by policy theory knowledge.

We categorized as **Other** those competencies that we were unable to easily link to other categories. A fair number of them were related to the integration of internal policies and programs within organizations, and so not related to public policy work.

The others, we were unable to place into one of the seven thematic categories because they were insufficiently defined, leaving us unsure as to their exact nature. For example, “assist entities with planning for structural and programmatic adjustments” (#20) may well have been placed in Policy Analysis/Development but worded in this way, it was not clear. In Figure 2 below, this category is excluded as it is neither a clearly defined nor a singularly defined group of competencies.

Figure 2 **Number of the 43 frameworks with competencies in each category**

4 What next for healthy public policy competencies?

What emerges from our review of the literature on public policy competencies for public health actors is a clear ordering, from most to least frequently occurring mentions, of the following thematic categories: Policy analysis/Development; Influence/Advocacy; Partnership/Collaboration; Communication; Policy context; Social determinants of health and Equity; and Policy Theory. It is worth repeating that very little detail about exactly what these competencies are or how they can be acquired is included in the frameworks. This represents a limitation for those seeking to integrate the competencies into their organizations. It also provides insight into a gap in the literature and thus an opportunity for research and further development of the competencies.

The ability to understand and intervene in the policy domain is increasingly a requirement for public health actors (David, 2019), and the competency categories we have outlined here may be of use as these actors seek to focus their work in this area. Additional work is needed in order to operationalize these competencies in terms of how they are to be learned and integrated into public health practice.

A recent trend in this direction has involved increasing capacity within public health organizations. For example, one regional health authority in Canada conducted a scan of healthy public policy practices in a number of health authorities with one of their objectives being to identify the various capacity building strategies within these organizations. In addition to identifying a need to build staff capacity for policy work, it was noted that support teams for policy work within organizations were needed (David, 2019). Others have made this observation as well and have noted that organizational conditions for healthy public policy work must extend beyond the capacities and competencies of individuals (Guyon et al., 2017). Indeed, public health authorities in Canada are increasingly aware that understanding the role of public policy is an important tool in their work and their organizations have a need to increase their capacity in this area (Guyon et al., 2017; David, 2019; Solorzano, 2019). As David notes in her scan, “A more robust and rigorous structure for healthy public policy is needed moving forward” (David, 2019, p. 2).

Conclusion

We hope that with this report we have contributed to the policy work being done by public health actors. This summary of competency frameworks will help bring to the fore those competencies that are the most frequently cited. Further, we here add our voice to those calling for this work to be strengthened by thinking about individual competencies within the context of capacity building programs, so as to bolster the former by developing tools and organizational structures which will make them stronger and thus more effective. At the National Collaborating Centre for Healthy Public Policy, we are committed to continuing our efforts to support public health practitioners, decision makers and organizations in this work.

Appendix A
Methodology

For this study, we adapted the PRISMA Extension for Scoping Review (Tricco et al., 2018) and completed a review of the scientific and grey literature on the topic of public policy competencies for public health actors.

On September 9, 2019, we conducted an EBSCO host literature search using the following databases: CINHALL, ERIC, Health Policy Reference Center, MEDLINE complete, Political Science complete, PsycInfo, Public Affairs Index. The search terms are included in Table 2 below.

Table 2 Search strategy for scientific literature

EBSCO host search used on 2019/09/09	
S1	TI(health or healthy or public) OR AB(health or healthy or public)
S2	TI(policy or policies or “public health”) OR AB(policy or policies or “public health”)
S3	TI(competency or competencies or competent or “skill” or “skills” or skillset or skillsets or expertise or “know how”) OR AB(competency or competencies or competent or “skill” or “skills” or skillset or skillsets or expertise or “know how”)
S4	S1 N4 S2 N4 S3
Date: 2000-2019	

Our search of the grey literature was conducted from October 9, 2019 to November 30, 2019 on various governmental, organizational, and academic websites and using general internet search engines. For this search, we used the same terms as for the search in the scientific literature and, in order to widen the search, we also explored references cited in the most relevant documents for any we may have missed. Table 3 below shows the search strategy for grey literature.

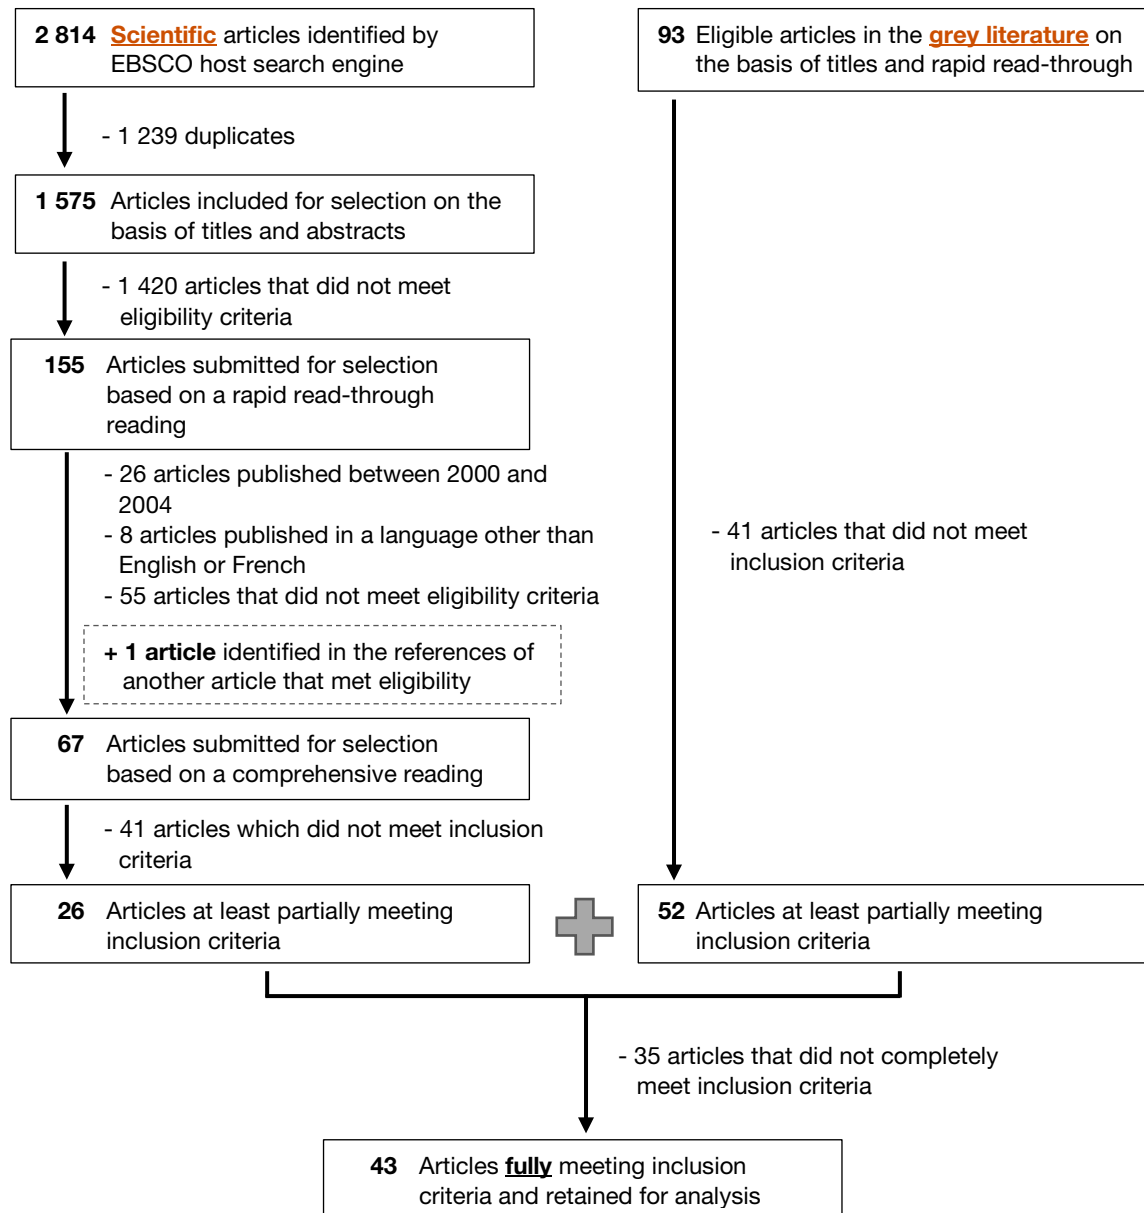

Table 3 Search strategy for grey literature
